

AIDE Competitive Landscape

Competitor profiles and comparison — internal use, compiled August 2026

What AIDE Is Actually Solving

A traditional nurse call button carries exactly one bit of information: someone wants something. The nurse walks to the room blind — could be water, pain relief, a bathroom trip, or an emergency. That creates wasted trips, no ability to prioritise by urgency, and slower response for patients who genuinely need something urgent.

AIDE's product is a specific four-part loop, and all four parts need to be present for something to be a functional competitor rather than an adjacent category member:

- Patient-initiated voice input — the patient speaks the request themselves, in the moment, with no hardware beyond a phone or browser.
- AI rephrasing into an action item — the raw transcript becomes a short, de-identified summary ("assistance requested," "water," "pain relief").
- A shared staff dashboard — the rephrased request appears for the ward before a nurse walks over, with room number and timestamp.
- A compliance-grade response log — original transcript, AI rephrasing, and total response time, recorded per request.

"AI voice in healthcare" has become a broad, crowded category label, and several companies below sit inside that label without doing the specific thing AIDE does. Four corrections worth holding onto:

- Hayylo is a client/family communication platform for home care — scheduling, updates, messaging. No ward, no bedside request, no shared staff dashboard. Shares Melbourne and an "AI voice for care" framing, nothing more.
- Capyra (AI Mily) solves interpreter access — the AI's job is translation accuracy between patient and clinician, not turning an ambiguous need into a triaged action item. No request routing, no dashboard.
- Hippocratic AI is a large language model platform for outbound calls initiated by the hospital or nurse (education, medication reminders, scheduling), not inbound bedside request capture.
- CipherHealth is a broad care-coordination platform touching the same general territory — surfacing patient needs to staff — through scheduled nurse rounding rather than an always-on patient voice channel, and is one module among many rather than a focused product.

None of these four are functional competitors to AIDE — they're included because they're part of the same broader conversation AIDE will get pulled into, and being able to draw this distinction cleanly matters more than treating the category as one undifferentiated pool. The one company in this research that matches AIDE's actual four-part loop closely — patient voice in, dashboard out — is Aiva Health, and even that requires in-room hardware AIDE doesn't.

Competitor Profiles

Companies operating in or near AIDE's space — voice-to-dashboard patient requests, AI-assisted nurse call, and adjacent patient-clinician communication AI — across Australia and the United States. Function vs. category overlap is called out explicitly per company.

Austco Healthcare — *Port Melbourne, VIC — ASX: AHC — incumbent hardware*

Australian-founded, ASX-listed nurse call manufacturer deployed across more than 5,000 healthcare facilities worldwide. Its Tacera and Medicom systems cover hospital and aged care nurse call, and Pulse Mobile, a staff messaging app, is rolling out to roughly 180 US hospitals through 2026. Austco has publicly discussed voice-assist and predictive, AI-enabled nurse call as a roadmap direction for several years but has not shipped a patient-facing voice product. Financially healthy and growing, with hospital relationships already in place across the markets AIDE wants to enter.

Rauland — *US-owned — deployed across Australian hospitals — incumbent hardware*

Long-established nurse call and staff duress hardware vendor, named directly in AIDE's own context document as the incumbent system AIDE sits alongside rather than inside. Provides handset-based staff messaging and alarm routing. No public evidence of a patient-voice or AI-rephrasing feature.

TigerConnect — *United States — software-first nurse call*

US clinical communication platform offering a vendor-neutral, AI-powered workflow orchestration engine that integrates nurse call with EHR, RTLS and other hospital systems. Provides real-time analytics correlating patient requests, staff presence and response data. Positioned as software-first rather than hardware-centric, which is the closest positioning match to AIDE among the larger incumbents, though it starts from staff communication and orchestration rather than capturing the patient's voice directly.

Hayylo — *Melbourne, VIC — home care communication platform, NOT a functional competitor*

A client and family communication platform for home care providers — scheduling, service updates, and messaging, with Hayylo Voice (launched April 2026) handling routine inbound calls in more than 20 languages. This is family/provider communication, not bedside patient-to-nurse request routing, and there is no ward, no shared staff dashboard, and no request-to-action-item pipeline. The overlap with AIDE is narrative only: same city, same broad "AI voice for care" framing.

Capyra (product: AI Mily) — *Melbourne, VIC — patient-clinician translation, NOT a functional competitor*

Founded by registered nurse Mily Lee with co-founders Manuel Becerra and Song Wu, Capyra builds real-time speech-to-speech AI translation so non-English-speaking patients can communicate with clinicians without waiting on scarce human interpreters. Graduated MedTech Actuator's Victorian Cohort 10 in late 2025 and has been running hospital pilots and clinician beta tests through 2026. The AI's job here is translation accuracy, not turning an ambiguous need into a triaged action item for staff — there is no request routing and no ward-wide dashboard. The overlap with AIDE is the founder story and ecosystem (nurse-founded Melbourne startup, same accelerator and grant pool), not the product.

Aiva Health — *Los Angeles, US — bedside voice AI*

The most mature global analog to AIDE's patient-side flow. Aiva's Patient Assistant is an Alexa-based in-room voice assistant deployed in more than 10,000 acute and post-acute rooms across the US

and Canada, integrating with more than 25 hospital systems — including Rauland nurse call, the same incumbent named in AIDE's own competitor list. A companion Nurse Assistant app supports voice charting and is used at Cedars-Sinai and BayCare. In August 2026 Aiva announced its assistant can run as a voice interface over ChatGPT for Healthcare, Claude for Healthcare and Gemini Enterprise across 40+ hospital IT systems, explicitly including Smart Patient Room requests. Not currently deployed in Australia, but the reference case any technical evaluator will raise.

Hippocratic AI — *Palo Alto, US — general healthcare LLM platform, NOT a functional competitor today*

Launched Nurse Co-Pilot in April 2026, co-developed with Cincinnati Children's Hospital, OhioHealth and Cleveland Clinic: an EHR-triggered AI voice agent that places outbound calls to patients for education, medication adherence and caregiver preparation, transcribing each conversation back to the chart. A companion AI Front Door product handles inbound scheduling and billing access. This is a broad, general-purpose healthcare LLM platform doing nurse-initiated outbound calling, not a patient sitting in a bed voicing an in-the-moment request. Extremely well-capitalised and moving quickly — the risk here is capability and pace enabling a future pivot, not current product overlap.

CipherHealth — *New York, US — multi-module care coordination platform, partial overlap*

A broad care coordination platform — rounding, outreach, follow-up, ticketing, analytics — that captures patient needs during structured nurse rounding rather than ad hoc patient-initiated requests, then routes escalations into real-time dashboards and clinical communication tools. The dashboard and escalation layer is the closest conceptual match in this research to AIDE's nurse dashboard and compliance log, and the underlying problem (surfacing real patient needs before they're missed) overlaps meaningfully. But the input mechanism is fundamentally different — scheduled rounding, not an always-on patient voice channel — and this is one module inside a much larger multi-problem platform, not a focused product like AIDE.

SONIFI Health — *Sioux Falls, US — in-room TV platform*

Turns hospital in-room TVs into a two-way patient interface for education, entertainment and service requests, with nurse call integration for hands-free requests. Addresses a version of AIDE's core problem — giving patients a channel to request things beyond the physical call button — through a TV interface rather than voice, with no AI-rephrasing or shared ward dashboard layer found in public materials.

Other adjacent players worth knowing

- Andromeda Robotics (Melbourne) — Abi, a companion robot for aged care residents using voice and ChatGPT-based interaction. Different modality (physical robot, not app) but competes for the same aged-care pilot slots and grant attention.
- Silverchain (WA) — piloting an AI voice assistant for in-home aged care, not facility-based.
- Infermedica / Nurse Triage Co-Pilot (Poland, deployed via Healthdirect Australia) — AI pre-triage and symptom-gathering for phone triage nurses, ahead of a call rather than at the bedside.

Comparison Table: AIDE vs. Competitors

AIDE's current MVP against the closest Australian and US players, across the core capabilities that define AIDE's product: patient-initiated voice input, AI rephrasing of the request, a shared staff

dashboard, and a compliance/response-time log. Where a competitor does not do what AIDE does, the cell reads “No — not available” rather than being left ambiguous.

- **Yes** *capability present and matches AIDE's function*
- **Partial** *an adjacent or reduced version of the capability*
- **No — not available** *capability does not exist in this product*

Note on Hayylo, Cappyra, Hippocratic AI and CipherHealth: these four sit inside the broader “AI voice in healthcare” category but are not functional competitors to AIDE — each solves a genuinely different problem (family communication, interpreting, outbound calling, and multi-module care coordination respectively). They're included for completeness and because AIDE will likely be mentioned alongside them by mentors, investors or grant panels; see “What AIDE Is Actually Solving” above for the specific distinctions.

Company	Base	Segment	Patient Voice Input	AI Rephrase	Staff Dashboard	Compliance / Response Log	Extra Hardware	Live in Australia
AIDE	Melbourne, VIC	Hospital + aged care	Yes	Yes	Yes	Yes	No — not available <i>BYO / phone only</i>	Yes <i>Pilot-stage</i>
Austco Healthcare	Port Melbourne, VIC	Hospital + aged care	No — not available <i>roadmap only, not shipped</i>	No — not available	Yes <i>Tacera / Pulse Mobile</i>	Partial	No — not available <i>requires call system</i>	Yes <i>incumbent</i>
Rauland	US-owned, deployed in AU	Hospital	No — not available	No — not available	Yes <i>handset-based</i>	Partial	No — not available <i>requires handsets</i>	Yes <i>incumbent</i>
TigerConnect	United States	Hospital	No — not available	Partial <i>AI orchestration, not patient voice</i>	Yes	Yes	No — not available <i>optional integration</i>	No — not available
Hayylo	Melbourne, VIC	Home care	No — not available <i>handles calls, not bedside requests</i>	Yes	No — not available <i>provider-side, not a ward</i>	Partial	No — not available	Yes
Capyra (AI Mily)	Melbourne, VIC	Hospital / clinic	No — not available <i>interpreting only, not requests</i>	Yes <i>translation, not triage</i>	No — not available	No — not available	No — not available	Yes
Aiva Health	Los Angeles, US	Hospital	Yes	Partial <i>via LLM layer</i>	Yes <i>integrated</i>	Partial	No — not available <i>requires Alexa devices</i>	No — not available
Hippocratic AI	Palo Alto, US	Hospital	No — not available <i>outbound calls, not inbound</i>	Yes	No — not available <i>via EHR, not a ward view</i>	Yes <i>chart transcript</i>	No — not available	No — not available
